My Wod Book

Description

My Wod Book allows you to store and categorize your wod routines each time you enter a crossfit box. Crossfit requires you to log your trainings exercises in order to keep progress, and select the weight for the training you are going to perform. MyWodBook will allow you to add this information, and will automatically categorize it in order to you be able to estimate the weight to your next training. It will also store automatically your PR's (Personal Records).

Intended User

This app is intended for crossfitters, but in the future can be adapted to any person that wants to train and log their works.

Features

MyWodApp main features are:

- App will be written solely in Java
- Load WOD (Work Of the Day) information.
- Auto categorize data loaded.
- Provide an already populated exercise list of exercises.
- View Progress data with graphics per exercise.
- Filter data per categories like muscle group, date, exercise, etc.
- Show PR's information.
- Take pictures and pre-load data from there.
- Last Workou Session Widget

User Interface Mocks

These can be created by hand (take a photo of your drawings and insert them in this flow), or using a program like Google Drawings, www.ninjamock.com, Paper by 53, Photoshop or Balsamiq.

Main Screen

Main Screen have a list of the logged trainings ordered by date.

Add/Edit Training Session

The sketch shows a mobile app interface for a training session. At the top, there is a hamburger menu icon and the title "Training Session". Below this is a section titled "Strength" which contains a table with columns: "Choose Exercise", "Sets", "Reps", "% RM", and a multiplier "x". A dropdown menu is open under "Choose Exercise", showing options: "Push press", "Back Squat", "Deadlift", and "...". Below the table is a section titled "WOD" with a large empty rectangular box. Underneath the box is a checkbox labeled "Rx" which is checked. Below that is a "Comments" section with a text input field. At the bottom of the main content area are two buttons: "x Cancel" and "✓ Save". At the very bottom of the screen is a "Banner Ad" placeholder.

Choose Exercise	Sets	Reps	% RM	x
+ Push press				
Back Squat				
Deadlift				
...				

WOD

☒ Rx

Comments

Banner Ad

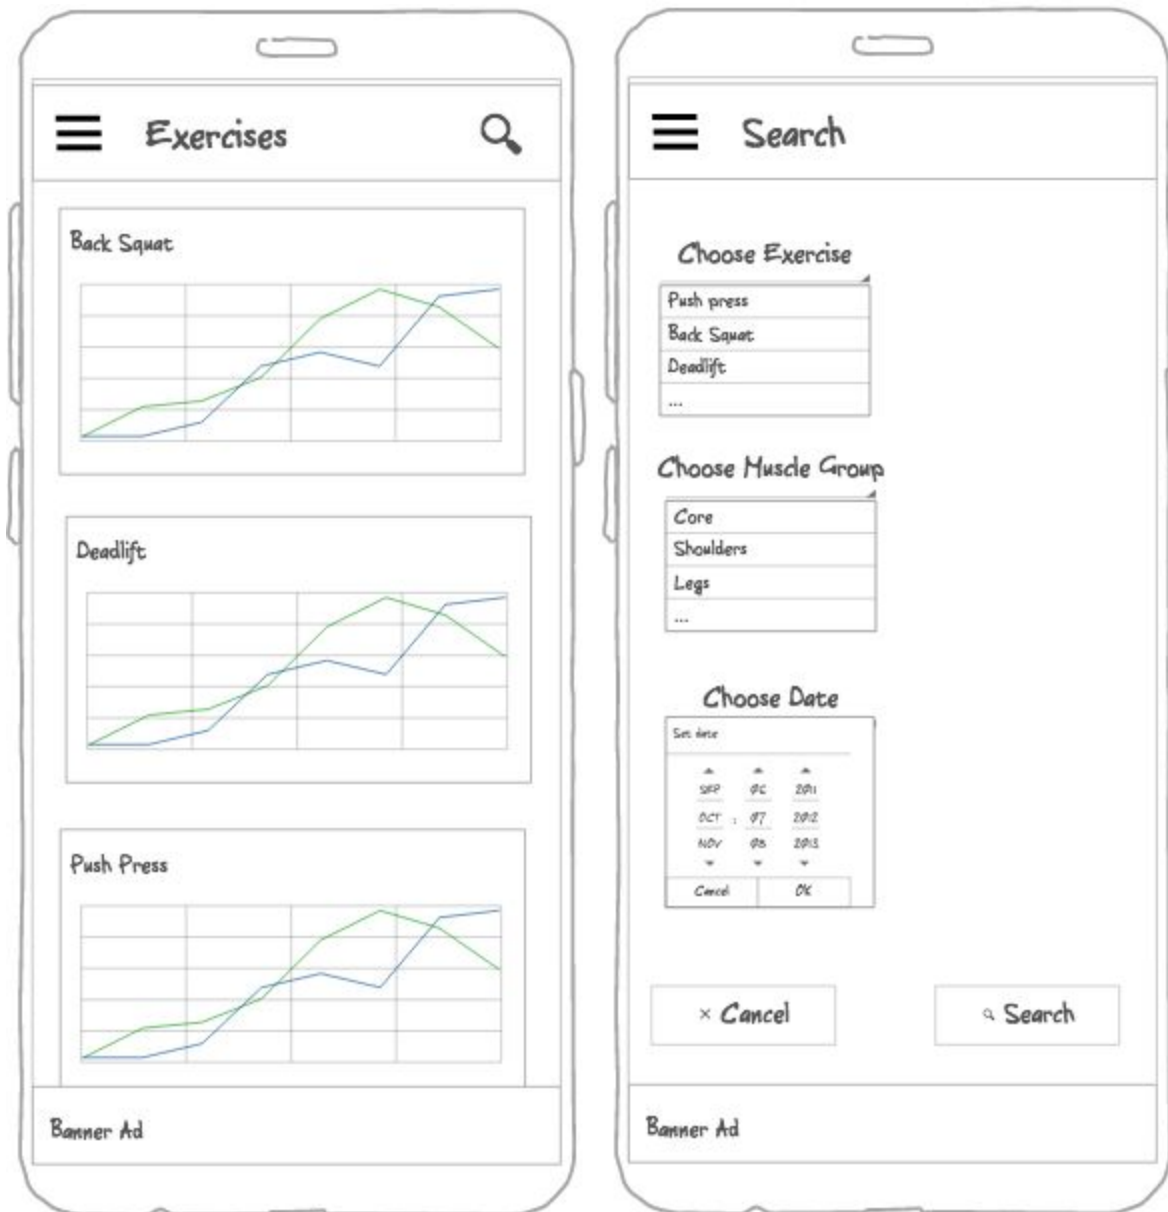

This screen allows you to add or edit the information of a training session.

Estimate Training Weight

This screen allows you to obtain an estimated weight to select on a certain training.

Exercise History Data

This screen shows you the information of your training sessions for a particular exercise.

PR Records

This screen shows you the list of your personal PR based on the information logged.

Last Exercise Widget

This screen shows you the last exercise you have logged in the app.

Key Considerations

How will your app handle data persistence?

We are going to store the user information and all the logged information of the training sessions made by that user.

To achieve that we are going to use Android Architecture Components Room and Lifecycle. For that we are going to generate each class for each table to store with `@Entity` annotation. Also we are going to provide `@Dao` interfaces to perform all the operations with the database.

Also we are going to use LiveData in order to return the information to ensure the data we are seeing is updated.

Describe any edge or corner cases in the UX.

For tablet and big screens, we are going to show a grid instead of a list for the main log screen, and the exercises table.

Describe any libraries you'll be using and share your reasoning for including them.

Android Studio 3.2.1

Gradle 3.2.1

Compile SDK version 28

AppCompat-v7:28.0.0

Android Architecture Components Room 1.1 - To generate the persistence layer.

Android Architecture Components Lifecycle 1.1 - To generate the persistence layer.

Butterknife 10.0.0 - To bind field methods and views. This will allow us to avoid boilerplate code.

Icepick 3.2.0 - To save and restore instance states.

Dexter 5.0.0 - To simplify the process of requesting permissions at runtime.

Retrofit 2.5.0 - To make http connections simpler.

GraphView 4.2.2 - To plot and show chart information of the logged training data.

Describe how you will implement Google Play Services or other external services.

To recognize text from photos we are going to try with 2 approaches.

First we are going to try to use Firebase ML Kit. This allows us to do this on the cloud or in the device itself if there is no connection. The only issue with this is as my latest test the accuracy of this approach wasn't the expected. The 2nd possible approach is going directly to use the GCP Vision API. This api use Auto ML Vision capabilities of GCP and seems like works better with OCR text recognition.

To show Ads we are going to use Admob Firebase. For this are going to follow this steps for a Banner Ads

<https://developers.google.com/admob/android/banner>

To obtain the list of exercises that we are going to log a service that is going to be provide it as a Firebase Realtime Database. This data is going to be accessed by the Activities with AsyncTaks that are going to get firebase client to obtain this data. As a future improvement of

the app we can provide another mechanism to update this list by the user if it is authenticated but is not part of this initial implementation.

Next Steps: Required Tasks

Task 1: Project Setup

This task consist in create the initial Project structure with all the required libraries and define the initial skeleton of the app.

- Configure libraries
- Design architecture visual components solution
- Implement initial skeleton of the app.

Task 2: Implement UI for Each Activity and Fragment

This task will consist in create all the Activities, Fragments and all associated classes and xml files to visually implement all the view components of the app

- Build UI for Main Logs View
- Build UI for Add/Edit Training Session
- Build UI for Exercises View
- Build UI for Search Exercise View
- Build UI for PRs Table View
- Build UI for Camera Picture View

Task 3: Implement Database layer

This task will create all the required classes to handle the persistence layer.

- Entities
- DAOs
- Database
- ViewModels

Task 4: Implement Service layer

- Create Exercise list service
- Create the service to extract info of the picture.

Task 5: Connect Persistence with UI

- Connect ViewModel with Activity, Fragments and Adapters

Task 6: Implement AdMob

Implement AdMob in all the views.

Task 7: Implement Last Exercise Widget

Create a widget to show the Last Exercise performed information.

Task 8: Testing

- Add unit test for services.
- Add integration tests for main flows.

Task 9: Productionisation

- Add label for all resources to ensure A11y for screen-reader.
- Ensure focus order of elements in pages to allow proper navigation.
- Select proper palette to ensure accessible colors and define and store properly on colors.xml.
- Ensure all texts are in strings.xml
- Ensure all measures are in dimensions.xml and follow the Android Material Design guidelines
- Define style in styles.xml and make sure all the xml files use this references instead hardcoded value
- Ensure all the steps from Android launch list are met.

Submission Instructions

- After you've completed all the sections, download this document as a PDF [File → Download as PDF]
 - Make sure the PDF is named "**Capstone_Stage1.pdf**"
- Submit the PDF as a zip or in a GitHub project repo using the project submission portal

If using GitHub:

- Create a new GitHub repo for the capstone. Name it “**Capstone Project**”
- Add this document to your repo. Make sure it's named “**Capstone_Stage1.pdf**”
